Bob Briscoe's work is part-funded by the European Community under its Seventh Framework Programme through the Reducing Internet Transport Latency (RITE) project (ICT-317700) and through the Trilogy 2 project (ICT-317756

Purpose of Talk

- Introduce latest AccECN protocol spec
 - awesome protocol design (IMHO)
 - satisfies numerous conflicting requirements
 - except not as simple as we'd have liked ☺
- seeking adoption, expert review and opinions
 - intent: Experimental
 - full spec (38pp) plus pseudocode examples,
 design alternatives & outstanding issues (+17pp)
 - consensus prior to implementation

The Problem (Recap) Congestion Extent, not just Existence

• Current 'classic' ECN feedback in TCP [RFC3168]

if (any packet marked in RTT) {signal 1}
else {signal 0}

• <ironic> Imagine using a 128b field for 2 addresses

if (any bit set) {address = 1}
else {address = 0}
</ironic>

- Only ECN-for-TCP is so clunky
 - TCP widely uses SACK to identify individual drops
 - modern transports (DCCP, SCTCP, RTP/UDP etc) feed back extent of ECN
 - need to update TCP, in its role as 1 of 2 transport protocols that work
- DCTCP feedback scheme would be nice, but:
 - 1. new wire protocol but no negotiation
 - 2. greatly confused by ACK loss
 - 3. higher congestion \rightarrow more ACKs

a new problem: feerback of bleached ECN

- erasure of ECN field to Not-ECT (00) in transit
 - RFC3168 notes that this could happen
 - and says it would be very bad
 - but doesn't say what to do about it
- if Not-ECT arrives at a classic EC[™] receiver
 - it does nothing, and can do nothing
- some tests show that bleaching ECN is common
- AccECN now includes Not-ECT feedback

Protocol Design

- Satisfied requirements with zero extra bits
 - essential part: overloaded 3 existing ECN flags in main TCP header
 - supplementary part: overloaded 15b in Urgent Pointer when redundant

0 0 1 2 3	4 5 6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3 0	1
Port no'	s, Seq	no	′ s	•••	•																					
Data Offset	Res- erved	N S	C W R	E C E	U R G	A C K	P S H	R S T	S Y N	F I N							ν	lin	do	W						
	Ch	nec	ks	um				-					N	on	-U:	rge	ent	: (if	UI	RG	==	: 0)		
TCP Opti	ons																									

- Non-Zero Urgent Pointer when TCP URG flag = 0?
 - middlebox traversal
 - seems better than for new TCP options in initial tests*
 - opportunistic not available when URG = 1
 - not useful for most other protocols that need more bits

^{*} Perhaps because earlier Windows versions did not zero the Urgent Pointer when URG=0

Protocol Design

2 complementary signals

- After successful capability negotiation
- 1. cumulative counters of the 3 ECN codepoints
- the sequence of ECN codepoints covered by each delayed ACK
- note: packet-based not byte-based counters
- note: pure ACKs are not counted (there are deep questions behind both these points)

-111

Protocol Design III Capability Negotiation

- AccECN is a change to TCP wire protocol
 - only to be used if both ends support it
- client negotiates support on initial SYN
 - using the 3 ECN-related TCP flags
 - server sets the 3 flags accordingly on the SYN/ACK
 or it replies as the latest variant it recognises
 - if nec. client downgrades to match the server
- supp. field not used until 3rd leg of handshake
 - consumes no TCP option space on SYN
 - if at any time supp. field = $0 \rightarrow \text{middlebox}$ interference

SYN

SYN/ACK

N	С	Ε	
S	W	С	
	R	Ε	
=	=	=	
0	1	0	

Protocol Design

Cumulative ECN Codepoint Counters

after SYN/ACK

- Data receiver counts arriving CE, ECT(1) & Not-ECT (11, 01 & 00)*
- Selects one counter to feed back in each ACK
 - encodes in the ACE field, overloading the 3 ECN flags
 - encoding fits a base 4, base 3 and base 1 counter in 3 bits!

0 1				
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5	ACE	CE (base 4)	ECT(1) (base 3)	Not-ECT (base 1)
DataRes-UAPRSFOffsetervedACERCSSYI	000	0		
G K H T N N	001	1		
	010	2		
ncludes 4 most significant bits of the	011	3		
elected counter in the supp. field	100		0	
	101		1	
	110		2	
	111			0

* ECT(0) found from remainder and from sequence field if available

Protocol Design 🔽

ECN Sequence covered by each Delayed ACK

- Value of ACE selects MK2 (no need to encode in ESQ)
- Receiver sends a Delayed ACK on any of these events:
 - a) Max delayed ACK coverage is reached (e.g. 2 full-sized segments)
 - b) Delayed ACK timer expires (e.g. 500ms)
 - c) Pattern becomes too complex to encode
- in one ACK, it is possible to encode a sequence of:
 - up to 15 segments for typical marking patterns
 - 3 segments for any possible marking pattern

Examples

AccECN Protocol Features Summary

Requirement	Classic ECN	ECN Nonce	DCTCP	AccECN Urg-Ptr	AccECN TCP opt	AccECN essential
Resilience	+	+	-	+	+	0
Timeliness	0	Ο	-	+	+	+
Integrity	-	0	+* +*		+*	+*
Accuracy	-	-	-	+	+	+
Ordering	-	-	+	+	+	-
Complexity	++	+	0	-	-	0
Overhead	++	Ο	0	0 + O		++
Compatibility	О	О	-	О	-	О

* = compatible with an independent zero-overhead integrity solution

Opportunistic but not Presumptuous?

- Presumptuous to reassign Urgent Pointer experimentally?
- While experimental:
 - use a TCP option for the supplementary part
 - Reserved 15b in Urgent Pointer
 - to use if this progresses to standards track
 - Experimental implementations required to recognise either location
- AccECN still 'works' if TCP option is cleared or discarded

0 0 1 2 3	456	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3 0	1

	Cł	nec	ks	um							Urgent Pointer															
TCP Opti	ons																									
Kind =	Xind = 0xKKLength = 4Supplementary AccECN																									
TCP Opti	TCP Options																									

Interaction with other TCP variants

- Server can use AccECN with SYN Cookies
 - capability negotiation can be inferred
- AccECN compatible with main TCP options:
 - Max Segment Size (MSS)
 - Timestamp
 - Window Scaling
 - Selective ACKs (SACK)
 - Authentication Option (TCP-AO)
 - TCP Fast Open (TFO)
 - Multipath TCP (MPTCP)
- AccECN consumes no option space on the SYN

even when deployed experimentally as a TCP option

Open Design Issues

- 1. Could simplify by removing sequence (ESQ) feedback entirely?
 - Instead require the receiver to disable delayed ACKs?
 - during slow-start (Linux receiver does this heuristically)?
 - requested by the sender?
 - But, is ACKing every segment acceptable?
- 2. Could simplify by using Urgent Pointer for experimental protocol?

• See Appendix C of draft, for these and 7 other more detailed issues

Top-ACE

Alternative Design Choices

Roughly highest importance first

- Earlier ECN feedback (on SYN/ACK)
- Remote Delayed ACK Control

- where to draw the line?

- Earlier ECN fall-back (on SYN/ACK)
- Shave 1 bit off ECN sequence field

See Appendix B of draft

summary & next steps

Requirement	AccECN Urg-Ptr
Resilience	+
Timeliness	+
Integrity	+
Accuracy	+
Ordering	+
Complexity	-
Overhead	+
Compatibility	0

- awesome protocol design (IMHO)

 capability negotiation and 3 counters in 7b
 even works in 3b, if middlebox clears other 4b
 - sequence of up to 15 x 4 codepoints in 10b
 - most likely of 2³⁰ combinations in a 2¹⁰ space
 - zero (extra) header bits
- still room for improvement
 - draft written to support consensus process
 - fully specified protocol, but also...
 - a container for design alternatives & issues
- adoption call please

More Accurate ECN Feedback in TCP (AccECN)

Requirements draft-ietf-tcpm-accecn-reqs-06 Proposed Protocol Spec draft-kuehlewind-tcpm-accurate-ecn-03

> Q&A spare slides

• SPace or MarK1 can be any of:

Protocol Features detailed explanations

- Resilience
 - DCTCP confused by ACK loss
- Timeliness
 - Classic ECN: only timely once per RTT
 - DCTCP is always 1 transition behind
- Integrity
 - ECN nonce: relies on receiver incriminating itself
 - DCTCP & AccECN compatible with approach in draft-moncaster-tcpm-rcv-cheat
- Accuracy
 - DCTCP lack of resilience impacts accuracy
- Ordering
 - 'AccECN essential' is the fall-back when a middlebox clears the sequence field
- Complexity
 - Hard to quantify
- Overhead
 - ECN Nonce marked down because it consumes the last ECN-IP codepoint
 - AccECN Urg-Ptr marked down because it prevents others using the Urgent Pointer
- Compatibility
 - Class ECN has had continuing problems with middlebox traversal
 - DCTCP is unsafe to interoperate with other TCP variants
 - 'AccECN Urg-Ptr' seems good at traversal, but more experiments needed
 - 'AccECN TCP opt' unlikely to traverse middleboxes that wipe TCP options

Requirement	Classic ECN	ECN Nonce	DC TCP	AccECN Urg-Ptr	AccECN TCP opt	AccECN essential
